Blinkit Sales Analysis — Business Recommendations

Prepared by: Aarav Sapra
Dataset: Blinkit Sales Dataset | Tools Used: MySQL, Excel, Power BI

RECOMMENDATION 1 — PRIORITISE HIGH MARGIN CATEGORIES

Finding:
Dairy & Breakfast leads in revenue at ₹1,46,792 but operates at only 20% margin. Pet Care, despite generating lower revenue of ₹96,031, produces the highest estimated profit of ₹33,611 at 35% margin. Instant & Frozen Food has the highest margin in the entire dataset at 40%.

Recommendation:
Blinkit should increase app visibility, shelf space and promotional spend on Pet Care and Instant & Frozen Food categories. Chasing revenue in low margin categories like Grocery & Staples (15% margin) is not an efficient use of resources. A shift in focus toward high margin categories can improve overall profitability without requiring higher order volumes.

RECOMMENDATION 2 — REDUCE DELIVERY DELAYS TO PROTECT CUSTOMER RETENTION

Finding:
Only 69.84% of orders are delivered on time. 20.92% are slightly delayed and 9.24% are significantly delayed — meaning 30% of all customers are receiving a substandard delivery experience. For a quick commerce brand where speed is the core promise, this is a critical operational risk.

Recommendation:
Investigate the 98 significantly delayed orders to identify if delays are concentrated in specific areas, time slots or delivery partners. Deploy additional delivery partners during peak demand hours and introduce real time delay alerts to customers to manage expectations and reduce negative feedback.

RECOMMENDATION 3 — IMPLEMENT PRIORITY RESTOCKING FOR TOP REVENUE SKUS

Finding:
Vitamins alone contributes 6.7% of total revenue making it the single highest revenue generating product. The top 8 products collectively contribute approximately 30% of total revenue. These are high velocity SKUs that directly impact business performance if they go out of stock.

Recommendation:
Implement a priority restocking policy for the top 10 revenue generating products. Stock levels for these SKUs should be monitored daily and replenished before hitting minimum thresholds. A stockout on Vitamins or Cough Syrup alone directly risks losing a significant share of daily revenue.

RECOMMENDATION 4 — RE-EVALUATE CUSTOMER SEGMENTATION STRATEGY

Finding:
Premium customers have an average order value of ₹1,101 — almost identical to New customers at

₹1,116 and Regular customers at ₹1,089. All 4 segments contribute equally at approximately 25% each of average order value. The current segmentation does not reflect meaningful spending differences.

Recommendation:
Blinkit should redefine its customer segmentation based on actual spending behaviour rather than assumed tiers. New customers spending as much as Premium customers suggests either the Premium label is incorrectly assigned or loyalty rewards are not effectively driving higher spend among Premium users. A RFM (Recency, Frequency, Monetary) based segmentation model would give more actionable customer groups.
